[Program Announcement 98094]

Measuring the Risk for Transmission and Sequelae From Chlamydial Disease in the Era of Amplification Testing; Notice of Availability of Funds for Fiscal Year 1998

A. Purpose

The Centers for Disease Control and Prevention (CDC) announces the availability of fiscal year (FY) 1998 funds for a cooperative agreement program on Chlamydia trachomatis (Ct) infection in order to enhance strategies for prevention of STD-related infertility. Please reference the Attachment for background information relevant to this program announcement. This program addresses the "Healthy People 2000" priority area 19, Sexually Transmitted Diseases.

The purpose of this research program is to gain a better understanding of the risk for Ct disease transmission and sequelae in the context of new, highly sensitive diagnostic technologies. When patient specimens are subjected to both standard non-amplification tests (culture, enzyme immunoassay [EIA], direct fluorescent-antibody [DFA], DNA hybridization) and highly sensitive nucleic acid amplification tests such as the polymerase chain reaction [PCR], ligase chain reaction [LCR], or transcription mediated amplification [TMA], some proportion of patient specimens will test positive by one diagnostic measure, and negative by another. Rarely, a specimen will test positive by standard non-amplification tests and negative by more sensitive tests (+/-). Much more commonly, a specimen which is negative by standard diagnostic testing will test positive by highly sensitive nucleic acid amplification tests (-/+). Such discordant specimens have usually been classified as true positives, or false positives on the basis of a highly sensitive third confirmatory test targeting a different portion of the Ct
